1. FUNCTION: Staphylococcal enterotoxins cause the intoxication staphylococcal food poisoning syndrome. The illness characterized by high fever, hypotension, diarrhea, shock, and in some cases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -1- COFACTOR: Binds 1 zinc ion per subunit. The zinc ion is necessary for the toxin interaction with MHC class II.
-1- SUBCELLUMAR LOCATION: Secreted.
-1- SIMILARITY: Belongs to the staphylococcal/streptococcal toxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Swaminathan S., Furey W.F. Jr., Pletcher J., Sax M.; "Residues defining V beta specificity in staphylococcal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ENTEROTOXIN TYPE C-2.

"Organization and nucleotide sequence of the Bacillus subtilis
"organization and nucleotide sequence of the Bacillus subtilis
diaminopimelate operon, a cluster of genes encoding the first three
enzymes of diaminopimelate synthesis and dipicolinate synthase.";
J. Balol. Chem. 268:9448-9465[1931]
-!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
-!- SIMILARITY: Belongs to peptidase family M16.
                                                                                                                                                                                                                                                                                                                                                                STRAIN=168 / 8G5;

resistance in Plasmodium falciparum from Thailand.";

Mol. Biochem. Parasitol. 57:151-166(1993).

-!- FUNCTION: Energy-dependent efflux pump responsible for decreased drug accumulation in multidrug-resistant cells.

-!- SUBCELLULAR LOCATION: Integral membrane protein.

-!- MISCELLANDEOUS: P. falciparium resistant to the drug chloroquine have multiple copies of the gene coding for MDR.

-!- SIMILARITY: Belongs to the ABC transporter family. MDR subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -ENKESDDOFLENTLLFKGFFTGHP-----WYNDLLVDLGS-----KDA----T

Pyrophosphate--fructose 6-phosphate 1-phosphotransferase alpha subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -!- SIMILARITY: TO OTHER PLANT ALPHA SUBUNITS AND ALSO, STRONG, TO THE BETA SUBUNITS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  6-PHOSPHATE 1-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -!- FUNCTION: The alpha subunit may be involved in the regulation of PFP by Fru-2,6-P (By similarity).
-!- CATALNTIC ACTIVITY: Diphosphate + D-fructose 6-phosphate = phosphate + D-fructose 1,6-bisphosphate.
-!- SUBJUNT: Tetramer of two alpha and two beta chains (By similarity).
                                                                                                                                                                                                           (ÉC 2.7.1.90) (FFP) (6-phosphofructokinase, pyrophosphate dependent) (Pyrophosphate-dependent 6-phosphofructose-1-kinase) (PPi-PFK).
PFP-ALPHA.

Pastoris Pas7p, a zinc-binding integral membrane protein of the peroxisome.";

Mol. Cell. Biol. 15.6406-6419(1995).

-!- FUNCTION: Nocessary for peroxisome assembly, essential for import of both PTS1 and PTS2 proteins, and required for the establishment of the peroxisome lumen.

-!- SUBCELLULAR LOCATION: Peroxisomal; membrane-associated.

-!- SIMILARITY: Contains 1 RING-type zinc finger.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     65 NDLLVD-LGSKDATNKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLTEEK

                                                                                                                                                                           -1- SUBULIT: Homodimer. The RNAP catalytic core consists of 2 alpha, beta, 1 beta' and 1 omega subunit (By similarity).
-1- DOMAIN: The N-terminal domain is essential for RNAP assembly and basal transcription, whereas the C-terminal domain is involved in interaction with transcriptional regulators and with upstream promoter elements (By similarity).
-1- SIMILARITY: Belongs to the RNA polymerase alpha chain family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          62; Gaps

                                                                                                                                                                                                                                                                                                                                  guanine-plus-cycosine sequences."

Eur. J. Biochem. 176:243-253(1988).

-! CATALTYTE ACTIVITY: Endonydrolysis of 1,4-alpha-glucosidic
linkages in oligosaccharides and polysaccharides.

-! COFACTOR: Binds 1 calcium ion per subunit (Potential).

-! SUBUNIT: Monomer (By similarity).

-! SUBUNIT: Monomer (By similarity).

-! SUBCELLAUAR LOCATION: Cytoplasmic.

-! SUBCELLAUGUS WHEN COMPARED TO AMYA, AMYB PRODUCED LARGER AMOUNTS

OF REDUCING SUGAR.

-! SIMILARITY: Belongs to family 13 of glycosyl hydrolases.
                                                                                                                          STRAIN-H-6-12; MEDLINE-88329076; PubMed=2458257; MEDLINE-88329076; PubMed=2458257; Horinouchi S., Fukusumi S., Ohshima T., Beppu T.; Cloning and expression in Escherichia coli of two additional amylase genes of a strictly anaerobic thermophile, Dictyoglomus thermophilum, and their nucleotide sequences with extremely low
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            317 NFWSIFYYNLKSEFPETFYFGEIVETPKETKKYVGKFDGTLDFYLFKIIRDFFIGKRWST

Microbiol. 138:313-318 (1992).

GEN. MICROBIOL. BROTERS WHICH BREAKS DOWN MILK PROTEINS DURING THE FUNCTION: PROTEASE WHICH BREAKS DOWN MILK.

- CATALYTIC ACTIVITY: Endopeptidase activity with very broad specificity, although some subsite preference have been noted, e.g. large hydropholic residues in the P1 and P4 positions, and Pro in the P2 position. Best known for its action on caseins, although it has been shown to hydrolyze hemoglobin and oxidized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -!- SUBCELLULAR LOCATION: Attached to the cell wall peptidoglycan by an amide bond (Potential).
-!- SIMILARITY: Belongs to peptidase family S8.
                                                                                                                                                                                                                                                                                                                                                                                                                 "Cloning, sequencing and expression of the gene encoding the cell-
envelope-associated proteinase from Lactobacillus paracasei subsp.
paracasei NCDO 151.";

Proc. Natl. Acad. Sci. U.S.A. 100:1990-1995(2003).
                                                                                                                                                                                              [RNA](N).
SUBUNIT: Homodimer. The RNAP catalytic core consists of 2 alpha, 1 beta, 1 beta, and 1 omega subunit (By similarity).
DOMAIN: The N-terminal domain is essential for RNAP assembly and basal transcription, whereas the C-terminal domain is involved in interaction with transcriptional regulators and with upstream promoter elements (By similarity).
SIMILARITY: Belongs to the RNA polymerase alpha chain family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             "Whole-genome random sequencing and assembly of Haemophilus influenzae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       STRAIN=RG / KW20 / ATCC 51907;

  breakage and subsequent rejoining of DNA strands. Topoisomerase II makes double-strand breaks (By similarity).
CATALVITY: ACTIVITY: ATP-dependent breakage, passage and rejoining of double-stranded DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      QGIGTGWSTNIPNYNPRELVKN------IKRLIAGEPOKALAPWYKN----

-!- CATALYTIC ACTIVITY: ATP + glycerol = ADP + glycerol 3-phosphate.
-!- PATHWAY: Glycerol utilization; rate-limiting step.
-!- SIMILARITY: Belongs to the fucokinase / gluconokinase /
glycerokinase / xylulokinase family.
                                                                                                                                                                                                                                                                                                                                                                                                  Nature 392:353-358(1998).
-!- FUNCTION: Key enzyme in the regulation of glycerol uptake and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -i. CATALYTIC ACTIVITY: ATP + L-arginine + tRNA(Arg) = AMP + diphosphate + L-arginyl-RNA(Arg).
-i. SUBUNTI: Monomer (By similarity).
-i. SUBCELLUTAR LOCATION: Cytoplasmic.
-i. SUBCELLUTAR LOCATION: Cytoplasmic.
-i. SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.

Pyrophosphate--fructose 6-phosphate 1-phosphotransferase alpha subunit
(EC 2.7.1.90). (PPP) (6-phosphofructokinase, pyrophosphate-dependent)
(Pyrophosphate-dependent 6-phosphofructose-1-kinase).(PPi-PFK).
Solanum tuberosum (Potato).

BIOI. CFGET. 265:18366-18371 (1990).

-1- FUNCTION: The alpha subunit may be involved in the regulation of PFD FUL-2.6-P.

-1- CATALYIC ACTIVITY: Diphosphate + D-fructose 6-phosphate = phosphate + D-fructose 1,6-bisphosphate.

-1- SINDINIT: Tetramer of two alpha and two beta chains.

-1- SINDINIT: Tetramer of two alpha and two beta chains.

-1- SINDINIT: TO OTHER PLANT ALPHA SUBUNITS AND ALSO, STRONG, TO THE BETA SUBUNITS.

This DNA polymerase also exhibits 3 to 5 exomolease activity. The alpha chain is the DNA polymerase (By similarity). CATALYTIC ACTIVITY: N deoxynucleoside triphosphate = N diphosphate
                                                                                                                                                                                                                                                                                                                                                                                               (composed of alpha,
                                                                                                                                                                                                                                                                                                                                                                                           + {DNA}(N).
Subnarrance III contains a core (composed of alpha, epsilon and theta chains) that associates with a tau subunit. This core dimerizes to form the POLIII' complex. PolIII' associates with the gamma complex (composed of gamma, delta, delta', psi and chi chains) and with the beta chain to form the complete DNA polymerase III complex (By similarity).
SUBCELIULAR LOCATION: Cytoplasmic (By similarity).
SIMILARITY: Belongs to the DNA polymerase type-C family. DnaE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               66 DLLVDLG-SKDATNXYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLTEEKK

                                                                                                                                                                                                        PUNCTION: Regulatory photoreceptor which exists in two forms that are reversibly interconvertible by light: the Pr form that absorbs maximally in the red region of the spectrum and the Pfr form that absorbs maximally in the far-red region. Photoconversion of Pr in Pfr induces an array of morphogenic responses, whereas reconversion of Pfr to Pr cancels the induction of those responses. Pfr controls the expression of a number of nuclear genes including those encoding the small subunit of ribulose-bisphosphate carboxylase, chlorophyll A/B binding protein, protochlorophyllide reductase, rRNA, etc. It also controls the expression of its and expression of its own gene(s) in a negative feedback fashion.

-!- SIMILARITY: Belongs to peptidase family S8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          specificity, although some subsite preference have been noted, e.g. large hydrophobic residues in the PI and P4 positions, and Pro in the P2 position. Best known for its action on caseins, although it has been shown to hydrolyze hemoglobin and oxidized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      from Streptococcus lactis NCD0763.";
Mol. Microbiol. 3:359-366(1989).
-!- FUNCTION: PROTEASE WHICH BREAKS DOWN MILK PROTEINS DURING THE GROWTH OF THE BACTERTA ON MILK.
-!- CATALYTIC ACTIVITY: Endopeptidase activity with very broad
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Lactococcus lactis (subsp. cremoris) (Streptococcus cremoris)
                                                                                                                                                                                                                                                                                                                                                                                                                                              PRT; 1902 AA

-!- FUNCTION: THE ABILITY OF BACTERIA TO BIND FIRRONECTIN HAS BEEN
PROPOSED AS A VIRULENCE FACTOR ENABLING BACTERIA TO COLONIZE
WOUND TISSUES AND BLOOD CLOTS. BINDING OF PLASMA FIBRONECTIN TO
THE BACTERIAL SURFACE MIGHT BLOCK APHESION RECEPTORS ON S.AUREUS,
THUS REPRESENTING AN IMPORTANT DEFENSE MECHANISM AGAINST TISSUE
